

REPLACEMENT PARAGRAPH BRIDGING PAGES 2 AND 3

This object is solved by providing films with a specific stamped pattern similar to a perforation; the stamped pattern predetermines the edges of cut for the future separation - by cutting or another method - of compounds from such films that are laminated to one another or joined otherwise. In this connection, the stamping defines at least one, generally several, stamped spacings ~~gaps~~ as dividing lines that can be arranged, for example, at a right angle to one another and are interrupted by webs in a regular pattern. These webs have a width that is, on average, less than the average spacing between two webs. In particular, it is preferred that the width of each web is less than the spacing of this web to the neighboring webs. Also, it is optionally preferred and in some cases necessary (for example, when three films according to the invention are provided for a ~~film~~ compound film) that the width of the webs, on average, is not more than half the average spacing between two webs.
